1. Executive Summary

The **BUTCHER Energy Station** is a next-generation fuel and energy retail facility planned for Caloocan South, Metro Manila — one of the most densely populated and

traffic-heavy corridors in the Philippines. The station combines traditional fuel dispensing with **EV fast-charging bays**, a **solar-panel canopy**, and a **modern convenience store**, positioning it as a forward-looking energy hub rather than a conventional gas station.

Caloocan South's strategic location at the intersection of EDSA (Monumento), Samson Road, Rizal Avenue Extension, and 5th Avenue (C-3) ensures a massive captive market of private vehicles, public utility vehicles, logistics trucks, and a growing number of electric vehicles. With a population exceeding 1.7 million and a density of approximately 32,180 persons per square kilometer, the area generates extraordinary daily traffic volumes.

The total estimated startup investment is **₱27,000,000** (excluding land acquisition), with revenue diversified across fuel sales, convenience store operations, EV charging services, and solar energy savings. The station is projected to achieve **full return on investment within 4 to 5 years**, driven by high fuel throughput, premium convenience store margins, and first-mover advantage in EV charging infrastructure within the Caloocan South market.

The project aligns with the Philippine government's **Electric Vehicle Industry Development Act (EVIDA — RA 11697)**, qualifying for fiscal incentives and positioning the brand at the forefront of the country's energy transition.

2. Company Overview & Vision

Brand Identity

BUTCHER is not a meat shop — it is a bold, disruptive energy brand designed to “butcher” the competition through superior facilities, modern design, and diversified energy services. The name is intentionally unconventional, creating instant brand recall in a market saturated with generic fuel station names.

Vision Statement

To become the leading independent modern energy station in Northern Metro Manila by delivering a premium fueling, charging, and convenience experience that sets a new standard for the Philippine downstream oil and energy retail industry.

Mission Statement

BUTCHER Energy Station exists to serve the Caloocan South community with reliable, competitively priced fuel; accessible EV charging infrastructure; a clean, modern convenience store; and environmentally conscious operations powered by solar energy — all within a facility designed for safety, efficiency, and customer comfort.

Business Structure

The recommended structure is a **Dealer-Owned, Dealer-Operated (DODO)** model. Under this arrangement, the owner retains full control of the land, facility, and equipment, while entering into a fuel supply agreement with a major oil company or operating as a fully independent retailer. The DODO model offers higher per-liter margins, long-term asset appreciation, and complete brand control — essential for establishing the BUTCHER identity.

Aspect	Detail
Legal Entity	Single Proprietorship or Corporation (SEC-registered)
Brand	BUTCHER Energy Station
Business Model	DODO (Dealer-Owned, Dealer-Operated)
Fuel Supply	Independent supply agreement or branded partnership
Location	Caloocan South, Metro Manila

3. Market Analysis

3.1 Demographics & Traffic

Caloocan South is the historical and commercial heart of Caloocan City. Unlike the more residential North Caloocan, the southern district functions as a primary transit hub and commercial-industrial zone for the entire northern Metro Manila region.

Metric	Value
City Population	1,712,945 (2024 Census)
Population Density	~32,180 persons/km ²
Key Commercial Nodes	Monumento Circle, Grace Park, Sangandaan
Primary Traffic Types	Logistics trucks, public transport (jeepneys/buses), private commuters

The area is served by four major traffic arteries, each generating distinct customer segments:

EDSA (Monumento Section) is the highest-volume road in the country. The Monumento terminus serves as a convergence point for provincial buses, city buses, jeepneys, and private vehicles. A station near this corridor captures both through-traffic and destination-based customers.

Samson Road is a critical east-west link connecting Caloocan to Malabon and Navotas. Traffic volume is consistently high with commercial delivery vehicles and jeepneys, making it ideal for diesel-heavy sales.

Rizal Avenue Extension is a major north-south commercial spine lined with hardware stores, banks, and small industries. This corridor generates steady weekday traffic from business owners and employees.

5th Avenue (C-3) is a vital logistics route for container trucks moving to and from the Manila North Harbor. This route represents a significant diesel market opportunity.

3.2 Industry Landscape

The Philippine downstream oil industry is dominated by the “Big Three” — Petron, Shell, and Caltex — but aggressive independents like Cleanfuel, Phoenix Petroleum, and Seoil have gained significant market share by competing on price and facility quality.

As of April 2026, fuel prices remain elevated:

Fuel Type	Price Range (₱/Liter)
Gasoline (Regular/Unleaded)	₱91.00 – ₱95.00
Diesel	₱85.00 – ₱92.00

These high prices create an opportunity for a competitively priced independent station to attract price-sensitive customers — particularly jeepney operators, truck drivers, and daily commuters.

3.3 EV Market Opportunity

The Philippine EV market is in its early growth phase, but momentum is accelerating. The **EVIDA Law (RA 11697)** mandates EV infrastructure development and provides fiscal incentives for charging station operators. Large commercial establishments are now required to dedicate at least 5% of parking spaces to EVs with charging points.

Current DC Fast Charging rates range from **₱35 to ₱55 per kWh**, with margins significantly higher than fuel sales. More importantly, EV charging creates **dwell time** — customers who spend 20–30 minutes charging are far more likely to purchase from the convenience store, dramatically increasing per-visit revenue.

By integrating EV charging from day one, BUTCHER establishes first-mover advantage in Caloocan South, where no existing competitor currently offers this service.

3.4 Competitor Analysis

Competitor	Location	Strengths	Weaknesses	BUTCHER Advantage
Shell	Monumento	Premium brand, strong C-store (Select)	Higher prices, heavy congestion	Competitive pricing, modern design
Petron	Rizal Ave	High brand loyalty, Fleet Card	Older facilities	Superior facility, EV charging
Cleanfuel	Samson Rd	Low price leader, clean restrooms	No EV charging, limited C-store	Full energy hub concept
Global Oil	4th Ave	Strong local presence	Limited marketing, basic facilities	Modern branding, diversified services

The competitive gap is clear: no existing station in Caloocan South combines competitive fuel pricing, EV charging, solar infrastructure, and a premium convenience store experience. BUTCHER fills this gap entirely.

4. Site & Facility Plan

4.1 Facility Design Overview

The BUTCHER Energy Station is designed as a **Fuel + EV Charging Facility** on a rectangular lot, following the detailed engineering blueprint (Sheet 1 of 4). The design prioritizes one-way traffic flow, safety, and operational efficiency.

4.2 Site Plan

The site plan (Scale 1:250) features a carefully engineered traffic circulation system. Vehicles enter from one side of the lot (“ENTRY ONLY”) and exit from the opposite side (“EXIT ONLY”), eliminating dangerous cross-traffic and ensuring smooth flow even during peak hours.

The central area is dominated by a large **solar-panel canopy** covering the fuel dispensing islands. This canopy serves a dual purpose: it shelters customers from rain

and sun while generating renewable electricity that offsets the station’s operational power costs.

4.3 Key Facility Components

Component	Specification
Fuel Dispensing Islands	4 multi-product dispensers (gasoline + diesel), serving 8 vehicles simultaneously
EV Fast-Charging Bays	2 DC fast-charging units (50–150 kW), with dedicated blue-marked parking
Solar Canopy	Rooftop photovoltaic panels covering the entire canopy structure
Convenience Store	Full-service store with cashier, storage rooms, and modern retail layout
Restrooms	Clean, well-maintained public restrooms (a key competitive differentiator)
Underground Fuel Tanks	High-pressure steel tanks with double-wall containment and leak detection
Fuel Piping System	Underground product lines connecting tanks to dispensers
Fire Suppression	Automatic sprinkler system and fire extinguisher stations per BFP standards

4.4 Floor Plan

The floor plan (Scale 1:100) shows the convenience store interior, which includes two storage rooms for inventory, a cashier counter positioned for clear sightlines across the store, and a retail area designed for impulse purchases — snacks, beverages, automotive products, and quick-service food items.

4.5 Engineering Details

The section view reveals the underground infrastructure: double-walled steel fuel tanks installed below grade with proper separation distances, fuel product lines running from tanks to dispenser islands, and drainage systems designed to prevent

fuel contamination of soil and groundwater — a critical requirement for DENR environmental compliance.

5. Regulatory Roadmap

Opening a gas station in the Philippines requires clearances from multiple government agencies. The process typically takes **6 to 12 months** from initial application to operational launch.

5.1 Required Permits and Licenses

Step	Agency	Requirement	Timeline
1	DTI / SEC	Business Name / Corporate Registration	1–2 weeks
2	DENR-EMB	Environmental Compliance Certificate (ECC)	2–4 months
3	DOE	Certificate of Compliance (COC)	2–3 months
4	LGU Caloocan	Building Permit & Locational Clearance	1–2 months
5	BFP	Fire Safety Inspection Certificate (FSIC)	2–4 weeks
6	LGU Caloocan	Business Permit & Mayor’s Permit	2–4 weeks
7	DOE / DTI	EV Charging Station Registration (under EVIDA)	1–2 months

5.2 Key Compliance Notes

The **Environmental Compliance Certificate (ECC)** from DENR-EMB is often the longest lead-time item. It requires an Environmental Impact Statement (EIS) or Initial Environmental Examination (IEE) depending on the project’s classification. The underground tank system must demonstrate double-wall containment, leak detection, and proper setback distances from water sources.

The **DOE Certificate of Compliance** is the core permit authorizing the sale of petroleum products. It requires proof of tank calibration, product quality testing capability, and compliance with the Philippine National Standards for petroleum retail.

The **BFP Fire Safety Inspection** is particularly rigorous for fuel stations. The facility must demonstrate adequate fire suppression systems, proper electrical grounding, vapor recovery systems, and emergency shutdown procedures. The blueprint’s inclusion of automatic sprinklers and fire safety infrastructure addresses these requirements.

For the **EV charging component**, registration under the EVIDA framework qualifies the station for fiscal incentives under the Strategic Investment Priority Plan (SIPP), potentially including income tax holidays and duty-free importation of EV charging equipment.

6. Products & Revenue Streams

The BUTCHER model is built on **four diversified revenue streams**, reducing dependence on low-margin fuel sales and creating a resilient business model.

6.1 Fuel Sales (Primary Revenue)

Fuel sales will constitute the largest revenue line by volume, though margins are thin. The station will offer unleaded gasoline, premium gasoline, and diesel through four multi-product dispensers.

Metric	Estimate
Target Daily Volume	8,000 – 12,000 liters
Gross Margin per Liter	₱1.50 – ₱2.50
Monthly Fuel Gross Profit	₱360,000 – ₱900,000

Volume is the key driver. The Caloocan South location’s high traffic density supports the upper range of these estimates, particularly for diesel sales to logistics trucks and public utility vehicles.

6.2 Convenience Store (High-Margin Revenue)

The convenience store is the profit engine of the modern gas station. With margins of **25% to 35%**, it generates disproportionate profit relative to its space.

Product Category	Margin Range
Beverages (Coffee, Soft Drinks)	40% – 60%
Snacks & Packaged Food	25% – 35%
Automotive Products (Oil, Coolant)	30% – 45%
Quick-Service Food (Rice Meals, Siopao)	35% – 50%
Cigarettes & Tobacco	8% – 12%

The store should be designed for impulse purchases, with high-margin items (coffee, hot food) positioned near the entrance and checkout counter. A monthly gross revenue target of **₱300,000 – ₱500,000** is achievable given the traffic volume.

6.3 EV Charging Services (Growth Revenue)

EV charging is currently a small but rapidly growing revenue stream. The two DC fast-charging bays will serve the early-adopter EV market in Caloocan South.

Metric	Estimate
Charging Rate	₱40 – ₱50 per kWh
Electricity Cost	₱12 – ₱15 per kWh (partially offset by solar)
Gross Margin	60% – 70%
Monthly Revenue (Year 1)	₱30,000 – ₱60,000
Monthly Revenue (Year 5)	₱150,000 – ₱300,000 (projected)

The true value of EV charging extends beyond direct revenue. Each charging session creates 20–30 minutes of dwell time, during which customers are highly likely to visit the convenience store. This **cross-selling effect** can increase per-visit revenue by 3x to 5x compared to a fuel-only customer.

6.4 Solar Energy Savings (Cost Reduction)

The solar canopy is not a direct revenue generator but a significant cost reducer. A gas station operates $\frac{24}{7}$, with substantial electricity consumption for lighting,

refrigeration, POS systems, and signage.

Metric	Estimate
Monthly Electricity Cost (Without Solar)	₱80,000 – ₱120,000
Solar Offset	20% – 40%
Monthly Savings	₱16,000 – ₱48,000
Annual Savings	₱192,000 – ₱576,000

Over a 10-year period, the solar canopy pays for itself multiple times over while contributing to the station’s green branding and EVIDA compliance.

7. Marketing & Competitive Strategy

7.1 Brand Positioning

BUTCHER positions itself as the **modern, no-nonsense energy station** — a place where customers get fair prices, fast service, clean facilities, and future-ready infrastructure. The brand deliberately breaks from the generic look of traditional gas stations with its bold name, dark color scheme, and premium design aesthetic.

7.2 Competitive Advantages

Price Competitiveness. As a DODO independent station, BUTCHER has flexibility to price fuel ₱1.00 to ₱2.00 below major brands, attracting price-sensitive jeepney operators, truck drivers, and daily commuters without sacrificing margin.

Facility Quality. The modern design, clean restrooms, well-lit forecourt, and organized traffic flow create a premium experience that rivals Shell Select stations at independent pricing.

EV Charging First-Mover. No competitor in Caloocan South currently offers EV charging. BUTCHER captures this emerging market from day one, building brand loyalty with early EV adopters who will become long-term customers.

Solar-Powered Branding. The visible solar canopy communicates environmental responsibility and technological modernity — values increasingly important to younger Filipino consumers.

7.3 Marketing Channels

Channel	Strategy
Grand Opening	Free fuel promo (first 100 customers), local media coverage, barangay partnerships
Social Media	Facebook and TikTok presence showcasing the modern facility, EV charging demos, daily price updates
Loyalty Program	BUTCHER Card — points-based system for fuel and C-store purchases, redeemable for discounts
Fleet Partnerships	Direct outreach to logistics companies, jeepney cooperatives, and ride-hailing drivers for volume accounts
Community Engagement	Sponsor local events, maintain clean public restrooms, support barangay programs

7.4 Customer Segments

The station targets four primary customer segments, each with distinct needs:

Daily Commuters represent the highest-frequency segment. They value speed, convenience, and competitive pricing. The one-way traffic flow and multiple dispensers minimize wait times.

Public Utility Vehicle (PUV) Operators — jeepney drivers and UV Express operators — are extremely price-sensitive and consume high volumes of diesel. Competitive diesel pricing and a fleet discount program will capture this segment.

Logistics and Trucking companies operating along 5th Avenue (C-3) and Samson Road require large diesel fills. Volume-based pricing agreements and extended operating hours (24/7) serve this segment.

EV Owners are a small but growing and affluent segment. They value reliable charging infrastructure and are willing to pay premium prices for convenience. The C-store

benefits significantly from their extended dwell time.

8. Operations Plan

8.1 Operating Hours

The station will operate **24 hours a day, 7 days a week**. Fuel demand in Caloocan South extends well into the night due to logistics truck movements and jeepney operations on early morning routes.

8.2 Staffing Plan

Position	Headcount	Shift Pattern
Station Manager	1	Day shift (Mon–Sat)
Assistant Manager	1	Rotating
Fuel Attendants	6	3 per shift, 2 shifts (12 hrs each)
Cashier / C-Store Staff	4	2 per shift, 2 shifts
Maintenance / Utility	2	Day shift + on-call
Security Guard	2	1 per shift, 2 shifts
TOTAL	16	

Estimated monthly payroll (including SSS, PhilHealth, Pag-IBIG contributions): **₱350,000 – ₱420,000**.

8.3 Fuel Supply & Inventory Management

Fuel will be sourced through a supply agreement with a reputable oil company or independent terminal. Deliveries will be scheduled during off-peak hours (typically 10 PM – 5 AM) to minimize traffic disruption and maximize safety.

Inventory management will use an automated tank gauging system that monitors fuel levels in real time, triggers reorder alerts at predetermined thresholds, and tracks daily

sales volumes for reconciliation. This system is critical for preventing stockouts and detecting potential leaks.

8.4 Safety & Compliance

Safety is non-negotiable in fuel retail. The station will implement:

Daily safety checks including fire extinguisher inspections, emergency shutdown system tests, and spill containment verification. **Monthly maintenance** of underground tank leak detection systems, dispenser calibration, and electrical grounding tests. **Annual compliance audits** with DOE, BFP, and DENR to maintain all permits and certifications. **Staff training** — all employees will complete fire safety, spill response, and first aid training before starting work, with quarterly refresher courses.

9. Financial Projections

9.1 Capital Expenditure (CAPEX)

Component	Cost (₱)
Civil Works & Site Preparation	6,000,000
Underground Tanks & Piping	3,500,000
Fuel Dispensers (4 Units)	2,000,000
Solar Canopy System	2,500,000
EV Fast-Charging Bays (2 Units)	3,000,000
Convenience Store Buildout	4,000,000
Permits, Licenses, & Professional Fees	1,000,000
Initial Working Capital (Fuel Inventory + Operating)	5,000,000
TOTAL CAPEX (Excluding Land)	₱27,000,000

Land acquisition or long-term lease costs are excluded as they vary significantly depending on the specific lot. Commercial land in Caloocan South ranges from **₱80,000 to ₱150,000 per square meter** for purchase, or **₱200 to ₱500 per square meter per month** for lease.

9.2 Monthly Operating Expenses (OPEX)

Expense	Monthly Cost (₱)
Payroll & Benefits	400,000
Electricity (Net of Solar Savings)	70,000
Water & Utilities	15,000
Fuel Delivery & Logistics	50,000
Maintenance & Repairs	30,000
Insurance	25,000
Marketing & Promotions	30,000
Permits & Compliance (Amortized)	10,000
Miscellaneous	20,000
TOTAL MONTHLY OPEX	₱650,000

9.3 Revenue Projections (Monthly)

Revenue Stream	Conservative	Moderate	Optimistic
Fuel Sales (Gross Profit)	₱360,000	₱630,000	₱900,000
Convenience Store (Gross Profit)	₱100,000	₱200,000	₱350,000
EV Charging (Gross Profit)	₱20,000	₱40,000	₱60,000
Solar Savings	₱16,000	₱32,000	₱48,000
Total Monthly Gross Income	₱496,000	₱902,000	₱1,358,000
Less: Monthly OPEX	(₱650,000)	(₱650,000)	(₱650,000)
Net Monthly Income	(₱154,000)	₱252,000	₱708,000

Under the conservative scenario, the station operates at a loss during the initial ramp-up period (first 6–12 months) as it builds customer volume. The moderate scenario — which is the most likely outcome given the location’s traffic density — generates a healthy monthly net income of approximately **₱252,000**, translating to an annual net income of roughly **₱3,024,000**.

9.4 Return on Investment

Scenario	Annual Net Income	ROI Period
Conservative	Break-even by Month 18	7–8 years
Moderate	₱3,024,000	4–5 years
Optimistic	₱8,496,000	2.5–3 years

The moderate scenario delivers a **full ROI in approximately 4 to 5 years**, which is consistent with industry benchmarks for well-located independent gas stations in Metro Manila. The optimistic scenario is achievable if the station captures significant fleet accounts and the EV charging market grows faster than projected.

10. Risk Analysis & Mitigation

Risk	Likelihood	Impact	Mitigation Strategy
Fuel price volatility	High	Medium	Diversified revenue streams reduce dependence on fuel margins
Regulatory delays	Medium	High	Engage a compliance consultant early; begin DENR-ECC process first
Competition from major brands	High	Medium	Compete on price, facility quality, and EV charging differentiation
Slow EV adoption	Medium	Low	EV charging is a supplementary revenue stream, not the core business
Natural disasters (typhoons, flooding)	Medium	High	Comprehensive insurance; elevated tank installations; flood-resistant design
Fuel theft or pilferage	Medium	Medium	Automated tank gauging, CCTV surveillance, strict inventory reconciliation
Supply chain disruption	Low	High	Maintain relationships with multiple fuel suppliers; keep 3-day buffer stock

11. Implementation Timeline

Phase	Activities	Duration
Phase 1: Pre-Development	Site acquisition/lease, business registration (DTI/SEC), engage architect and compliance consultant	Months 1–2
Phase 2: Permitting	Submit ECC application to DENR-EMB, apply for DOE COC, secure LGU building permit and locational clearance	Months 2–6
Phase 3: Construction	Civil works, underground tank installation, canopy and solar panel installation, C-store buildout, EV charger installation	Months 5–9
Phase 4: Pre-Operations	BFP fire safety inspection, DOE final inspection, equipment testing and calibration, staff recruitment and training	Months 9–10
Phase 5: Soft Launch	Limited operations, test all systems, gather initial customer feedback, fine-tune operations	Month 11
Phase 6: Grand Opening	Full operations, marketing campaign launch, fleet partnership outreach, loyalty program activation	Month 12

The total timeline from project initiation to grand opening is approximately **12 months**, with permitting and construction phases overlapping where possible to compress the schedule.

Appendix: Blueprint Reference

The facility design is based on the BUTCHER Energy Station engineering blueprint (Sheet 1 of 4), which includes:

- **Site Plan** (1:250) — Overall lot layout with one-way traffic flow, fuel islands, EV bays, and convenience store
- **Floor Plan** (1:100) — Interior layout of the convenience store with storage, cashier, and retail areas
- **Front and Side Elevations** (1:100) — Exterior design with BUTCHER branding and solar canopy profile

- **Section View** (1:100) — Underground tank placement, fuel piping, and structural details
 - **Engineering Details** — Specifications for underground steel tanks, EV charging stations, fuel dispensers, fire suppression systems, and drainage
-

***Disclaimer:** This business plan is based on publicly available market data, industry benchmarks, and regulatory frameworks as of April 2026. Actual costs, revenues, and timelines may vary based on site-specific conditions, market changes, and regulatory developments. Professional consultation with a licensed engineer, environmental consultant, and business attorney is recommended before proceeding with investment.*

BUTCHER Energy Station — Fuel the Future.
